Why choose Wienerberger?

Wienerberger AG is a global provider of building materials and infrastructure solutions located at the Wienerberg in Vienna, Austria, hence the company name. Wienerberger is the only multinational and the world’s largest producer of clay blocks for walls, bricks for facades (including facade systems), clay roof tiles and clay pavers with leading market positions. Founded in 1819, Wienerberger can look back on more than 200 years of successful business. Today, we have more than 200 production sites in 30 countries and showrooms in several European countries.

Wienerberger Building Solutions

The production, supply and distribution of building materials made of clay are the core business of the Wienerberger Building Solutions business unit. Concentrating on the international business, Wienerberger World is part of Wienerberger Building Solutions and is located in Kortrijk, Belgium.

Mission Statement

Our Vision

We want to be the most highly regarded producer of building materials and infrastructure solutions, and the preferred employer in our markets. We share our values, our knowledge, our experience and our success.

Our Mission

We improve people's quality of life by providing outstanding, sustainable building material and infrastructure solutions.

Our Culture

Together, we live our values, we share our mission, our vision and our success. Our corporate identity and our corporate culture are characterized by international diversity and positive, forward-looking dynamics.

Our Goal

The primary goal of our entrepreneurial activities is to achieve a sustainable increase in the value of the company in accordance with ecological, social and economic principles.

Our Values

Expertise, Passion, Integrity and Respect, Customer Orientation, Entrepreneurship, Quality and Responsibility. Our values form the basis of our entrepreneurial activities. We live by our values and share them in our day-to-day cooperation.

Our Employees

Our employees are crucially important for the success of our company. Thanks to their professionalism, their passion and their entrepreneurial spirit we can seize opportunities, take purposeful action, and create value for our shareholders.

We work according to four pillars

Value

When we say value, we don't mean cost. Throughout the supply chain we demand that our products and services exceed rather than just meet expectations. That way we ensure we offer true value to our shareholders.

Innovation

We're dedicated to finding new ways to be better. That means embracing new technologies, exploring new techniques and investing in new ideas to help our products and services deliver a better quality of life.

Sustainability

Sustainability is not just a commitment towards minimising our impact on the environment; it's a commitment to be better across the board. We take great care with the resources we use and embed our products with industry-leading innovations.

Quality & Expertise

Our global manufacturing heritage spans two centuries. Whether it's an innovative clay block walling system or a traditional handmade roof tile, we apply exacting quality standards to our work.

Sustainability at Wienerberger

WOW – World of Wienerberger – stands for our self-concept to provide solutions that make the world a better place

Sustainability is not just a fad in our 200-year history. It has always been at the core of the world of Wienerberger and constitutes a crucial element of our corporate strategy and our decisions. Our solutions are the key to creating sustainable infrastructure and buildings for generations. We assume responsibility by taking environmental, social and governance (ESG) aspects into account. Our Wienerberger Sustainability program 2023 is founded on three environment-related pillars: decarbonization, biodiversity, and circular economy.

Mobility also plays an important role in the building sector's climate passport. Transport by water offers a number of undeniable advantages.

Decarbonization

Energy efficiency and decarbonization are central issues in all of Wienerberger's business areas. We therefore share the global vision of a CO₂-neutral economy and are determined to contribute to climate protection with our products. In our ceramic production, we will further reduce our greenhouse gas emissions through the technological optimization of our production processes and by increasing the use of green electricity at all Wienerberger production sites. Alongside improvements of existing processes, we are employing new technologies and developing innovative products in R&D projects in order to reach our ambitious targets for 2023 and beyond.

TARGET FOR 2023:
A 15% reduction of our CO₂ emissions compared to 2020.

Biodiversity

Biodiversity is a crucial topic for each of our 197 production sites. At Wienerberger we feel dutybound to respect nature reserves and to use our resources sparingly. By fostering biodiversity, we will further optimize our land use in order to contribute toward an increased presence of flora and fauna. We have therefore set ourselves the ambitious target of integrating all our local activities aimed at protecting biodiversity into a uniform program.

TARGET FOR 2023:
A biodiversity program for all our sites.

Circular economy

One of our ecological targets is to put even greater emphasis on a circular economy. On the one hand, secondary raw materials from internal or external sources are to be reintroduced into the production processes after thorough quality checks. On the other hand, products are to be designed so as to be reusable at the end of their service life. This underlines our strong commitment to resource efficiency and closed value creation cycles. Our target is to ensure that 100% of our new products are recyclable or reusable.

TARGET FOR 2023:
100% of our new products designed to be recyclable or reusable.

Why building with clay?

Besides being natural, high-quality and maintenance-friendly, ceramics are sustainable in all production stages – from raw material extraction to production and packaging, through to processing.

Clay bricks and roof tiles are among the oldest building materials in the world and are still extremely popular. This does not come as a surprise, because clay building materials are natural, versatile, durable and of stable value. Selecting the right building materials is a decision for a lifetime.

Customers who choose roof tiles, facing bricks, clay blocks or pavers by Wienerberger play it safe – and enjoy more advantages, as compared to other building materials.

1. Versatile

Clay building materials can be used for a variety of applications. They can be used for walls, facades and roofs as well as for gardens, terraces and open spaces. Clay tiles and bricks can be used almost anywhere and for all architectural styles, whether for the construction of single-family houses or apartment blocks, office or public buildings.

Why building with clay?

2. Energy-efficient

Owing to their excellent insulation properties and their heat storage capacity, clay building materials help to reduce the energy consumption of buildings.

3. Durable

Clay building materials are robust, stable and, as a result, especially durable; their lifespan is more than 100 years. Brick buildings, which have lasted for centuries, can be discovered all around the world. Buildings made of clay tiles and bricks are weather-resistant, earthquake-proof and fire-resistant.

4. Aesthetic

Clay bricks and tiles are aesthetic and versatile. Thanks to a wide range of available colours, shapes and surfaces, the number of possible designs and variations is almost unlimited. The colour spectrum ranges from super white to classic red to coal black. Available variants include rough, smooth and glazed surfaces, elongated and wide formats. Roof tiles and facing bricks as well as pavers can be perfectly coordinated with one another.

Why building with clay?

5. Economic

A solid building envelope made of brick can be constructed quickly and flexibly – this saves both time and money. Wind and weather, heat and frost are not able to damage clay building materials. As a result, maintenance and service costs are low. Owing to their favourable insulation properties, clay building materials also help to save energy costs.

6. Natural

Clay blocks, facing bricks and clay roof tiles as well as pavers are particularly sustainable and natural building materials because they consist of the natural raw materials clay and water. Bricks and tiles are absolutely free of pollutants and allergens and, thus, especially compatible with humans and nature.

7. Stable in value

Even after many years, buildings made of clay building materials retain their value - or have an even higher value. Owing to their durability, stability and special living quality, brick buildings and apartments are in great demand and achieve high resale values. Furthermore, bricks and tiles are easy-to-clean and low-maintenance.

The Wienerberger Brick Award

For more than a decade now, Wienerberger AG has been hosting the international Brick Award every two years, providing a stage for excellent brick architecture and its architects.

Wienerberger initiated the Brick Award for the first time in 2004, in order to put this natural building material into the spotlight, demonstrating how exciting, exceptional and modern architecture using brick can be.

Although Wienerberger is the host of the award, it is an independent award and the use of Wienerberger products is no decisive factor for participation. Independent architecture critics, experts and architects are invited to submit innovative and creative buildings and other construction works made of clay building materials. The spectrum of applications ranges from building solutions using classic clay blocks, facing bricks and roof tiles to the creative application of clay pavers and ceramic facade panels.

Over the last years, projects have been submitted from all over the world and nominations as well as winners have been chosen using a wide range of manufacturers and brick types in all colours and shapes. In a dialogue with you, architects and architecture fans as well as critics, we want to further strengthen the public focus on the aesthetic and functional aspects of this great building material.

Specialist design, technical expertise

Wienerberger offers specialist design and technical expertise, providing effective and helpful advice to achieve successful brickwork.

The services offered range from guidance on the most appropriate product selection for particular projects and applications, to final product specification, including current building standards and codes of practice, special shaped bricks, bond patterns, movement joints and brickwork detailing.

Tailormade solutions, let's make creative and individual ideas come true.

Architects want to realize their own, individual ideas. To get inspired, they want to see and feel products in order to develop their own vision. By offering the possibility to create a Special Customer Request, Wienerberger tries to meet the customer's vision in developing the right product.

How does the process work?

The product requirements are defined together with the architect; functionality and aesthetics are key. A visit to our production units to start and work on the process together with the team is highly preferable.

For the development of custom-made facing bricks, different parameters like clay mixture, format, structure, engobing and firing method are used. With an agile method on a small scale, a minimum viable product (MVP) is produced to show how the product will look - with as less means as possible. An agile response to the customer's feedback on every MVP is key. For this intense and highly creative process a very close cooperation with the project decision makers (architect, developer, ...) is needed.

During the last years, a lot of sample products are available to inspire interested customers in this process. Developed products may also be a starting point for other projects.

Today, our team of experts has been successfully working on projects in Belgium, the USA, Norway, Russia and China.

Types of bricks

Bricks come in a wide range of types, colours and sizes. Choose from a whole assortment of hand-moulded bricks, extruded bricks, pressed bricks, braised bricks, smooth waterstruck bricks, tumbled bricks, grooved bricks and so on.

Hand-moulded bricks

Hand-moulded bricks used to be made by hand, as the name suggests, but today ultramodern machines have taken over the process. But the end result is the same: the bricks look as though they have been made by hand, with uneven and rough sides. The grains and uneven sanding also add to their unique character. And by mixing the types of clay used, there are all sorts of great colour variations you can go for. The result? A great-looking wall, but still with plenty of interest!

Braised bricks

Braised bricks have a touch of individuality: a special 'braising' process gives the bricks a unique shade of grey. The final colour depends on all sorts of factors: the basic colour of the brick, the way they are stacked in the braising kiln and the addition of other substances during the braising process. In any event, at Wienerberger you'll find a lot of contemporary grey bricks to produce a facade you'll fall in love with.

Extruded bricks

The name says it all: the clay is pressed into a long strand and then cut into brick format. The process also allows for larger sizes. And these bricks stand out because of their sleek, linear appearance.

Waterstruck bricks

These are special bricks. The name refers to the process used for removing the bricks from their moulds in which water is used instead of sand. This gives them a smooth, planed and unsanded surface structure. The process also highlights the natural colour of clay more, delivering endless creative possibilities.

Pressed bricks

With these bricks, the clay is pressed into moulds and then rolled. This gives you a contoured brick with minimal or even no grain, creating a well-defined look.

Brick sizes

Do you want to opt for large bricks that are fast to build with for contemporary-looking facades, or maybe smaller ones that offer a maximum of variety? Whatever the size of brick you choose – big or small, thick or thin – you’ll find what you’re looking for at Wienerberger.

Bonding patterns

Achieving different looks

Bonding refers to the way in which the bricks are laid. The primary purpose of bonding is to ensure the brickwork is strong and stable. However, it can also have a dramatic effect on the visual appearance. Today's architect has a huge selection of masonry bond patterns to choose from. To point you in the right direction, here's a summary of the most commonly used bond patterns below.

Stack bond

Three quarter bond

Brazilian bond

The claustra or Brazilian bond is a bond that is characterised by many openings in the masonry. These openings result from the fact that the facing bricks are supported only at the ends by the underlying facing bricks. The openings that are thus created give the masonry a transparent character. Point of attention when using the Brazilian bond: the overlay between the bricks must at least be three quarters of a brick.

Hoornbloem

Architect: Sileghem & Partners, Zwevegem, Belgium

Block Bond

Stretcher bond

English bond

Wild bond

Mortar colour

Another key consideration for determining the overall appearance of your building is the colour of mortar you use. Mortar actually accounts for 15 - 17% of the visible brickwork (dependant on bond pattern) and the colour chosen can change the look of your wall considerably.

Facing bricks show your personal style, but don't underestimate the effect of the mortar joints used to lay them. If you want coloured mortar, you'll need to match it with the colour of your brick. Light joints produce a light wall, whereas dark joints do the opposite. If you go for a mortar joint that's the same colour as the brick itself (tone-on-tone), your wall will have a nice even appearance. Or maybe you'd rather have no joints at all? In that case, using adhesive or thin bricks can be a good alternative: that way, the bricks are laid close together, creating an expressive wall.

Below are some examples of how different mortar colours can significantly change the look of the same brick.

Medium mortar

Same joint colour

Glued bricks

Masonry with thin joints

Thin joints are hotter than ever. Thin joints give your wall a lovely solid look, bringing your facade into its own. You have 3 options to choose from:

Adhesive

If you opt for adhesive, a thin layer of mortar is used between the bricks. The specific composition of the bonding mortar ensures the perfect bonding strength. This makes the joint virtually invisible, which in turn highlights the look of the brick itself. In fact it looks as though the bricks have simply been stacked on top of each other.

Thin brickwork

With thin brickwork, a special mortar is used that enables thinner joints to be created. This mortar is applied using a smaller trowel. The result is the same as with using adhesive: a solid, expressive wall in which the bricks play the starring role.

Iluzo: the look of adhesive-bonded

As a result of the growing success of thin joints, Wienerberger has developed a smart brick: Iluzo. This brick combines the benefits of classic mortar brickwork with the benefits of thin masonry.

The Iluzo has a thin joint at the front and then a hollow that still enables a 12 mm layer of mortar to be applied. The Iluzo makes brickwork with thin joints even easier than before. Is Iluzo an illusion? No way! But you're sure to get a multi-coloured and innovative facade.

All of our facing bricks are suitable for traditional masonry, as well as for brickwork with adhesive and thin mortar joints.

Waterstruck Special Orient Red
Architect KAAO architecten,
Rotterdam, The Netherlands

Iluzo Pagus Grey-Black

Iluzo, laid traditionally but with a glued appearance

Iluzo makes thinly-jointed facades easy, affordable and stylish

Glued and thinly-jointed bricklaying is very popular these days. And rightly so, because many advantages can be realised by reducing joint thickness from 12 mm to approx. 4 mm. The bricks give the impression of being very closely spaced, which helps to better emphasise the solid and homogenous nature of the facade. And while classic joints have a major impact on the colour of the facade, this impact is reduced significantly when thin joints are used. A glued or thinly-jointed facade also ages slower, because joints have less impact on the overall colour.

Iluzo makes it possible to easily realise all these effects. This brick looks like it has been glued, but still offers the advantages of traditional bricklaying. This means professionals can simply use traditional mortar as they are accustomed.

In short: Iluzo combines the stylish appearance of glued bricklaying with the benefits of traditional bricklaying. The result? Convenience combined with aesthetic appeal.

Iluzo features a hollow area on the laying surface of the brick. This means a regular mortar layer of 12 mm is possible and there is enough freedom to lay bricks perfectly flat and equal.

2 support feet offer extra support and allow excess mortar to escape.

Due to the hollow section of the laying surface, a 12mm layer of mortar is still possible. This means bricks can be laid perfectly flat and evenly.

Bricklayers can simply use the same number of left and right-hand headers to lay a corner.

Brick slips, efficient use of energy and space

Brick slips have a wide range of internal and external applications. They are used across a range of market sectors – for residential and commercial applications, for smaller features, full rooms or complete building exteriors, and for both new build and retrofitting or renovation projects.

Ideal for facade renovation

Brick slips are the ideal solution for maximizing the space saved during facade renovation. Where the width of a traditional brick is not available, these brick slips – with a thickness of 9 mm to 22 mm – are a very practical solution. Their slim profile also means that brick slips offer numerous options for insulation thickness, yielding lots of possibilities for energy savings.

Our on-line pressed brick slips are available with a thickness starting from 9mm.

Perfect for new build houses and high-rises

Once the brick slips are in place, they are almost indistinguishable from whole bricks. Virtually all facing bricks in our product range are also available as brick slips with the same qualities and properties as their 'big brothers'.

Bricks in an interior setting: a captivating effect

By integrating bricks into interiors, you create a surprising touch, exciting colour and light effects, and have endless possibilities in terms of combinations and creativity.

Brick slips offer a flexible way to get the style you want and can be fitted to a range of surfaces as a quick, easy and cost-effective way to create an authentic brick finish that offers low maintenance and long-term durability.

The performance benefits of brick slips are similar to those of brick – a breathable, non-combustible, durable, recyclable and energy-efficient material. No other cladding solution offers this combination of beauty and practicality.

Brick slips are the ideal solution for creating memorable and impactful interiors for retail, hospitality and commercial spaces. We know that, when designing or refreshing a boutique, restaurant, hotel or office interior, time and space are incredibly valuable. Brick slips allow you to construct an authentic-looking brick wall with speed, using up minimal floor space and creating little mess.

Eco-brick[®], the slim-line look isn't the only difference

An Eco-brick is less wide, so you can add up to 3.5 cm more insulation and that is great for your energy bills.

Eco-brick is a genuinely contemporary wall facade brick. The bricks are less wide, allowing you to add up to 3.5 cm more insulation and substantially save on your energy bills. The reduced thickness can also leave you more living space on the inside. And your housing is guaranteed to have more appeal, because Eco-brick is available in numerous, timeless colours - including a number of entirely new shades.

More insulation

More living space

And what about using bricks that are less thick for renovation work? Breaking open an old facade to insulate it, or insulating a solid wall and cladding it with new bricks? Eco-bricks leave more space for insulation, which offers more alternatives if you have to do renovation work within existing decreed perimeters.

And finally, the reduced weights mean they are easier to use on the site, and guarantee more energy-efficient and less polluting transport.

Agora Agate Grey Eco-Brick

GW2-architecten, Raf Wouters, Blankenberge, Belgium

LESS is more

As an alternative solution for durability, Egernsund Wienerberger has developed a new brick with 3 small holes. LESS has exactly the same dimensions and appearance as a traditional Danish soft brick. The only difference is that LESS reduces both the carbon footprint and raw material consumption by double-digit percentages.

LESS is another step in Wienerberger's roadmap for 100% CO₂-neutral production

Metropolis Vesta Black

Glazed bricks, eye-catching creativity

Standard and Made to Order

Think out of the box, with Terca glazed bricks for monumental surfaces as well as for subtle details. Standard and in stock, the Wienerberger range comprises six colours: red, ivory white, blue, green, yellow and black. Suppliable in 'Waal' and 'English' format from an extruding press. These colours are available on request in smooth (press moulded) or with a rustic look (hand moulded). There are also 37 other standard colours available: clean (extrusion press), smooth (pressed mould) and rustic (hand-mould).

Customised

You need not feel limited to the 43 standard colours. Almost all RAL colours can be produced per project, with specific finishes like pearl, metallic and glitter if required. Finishes with transparent glaze are also possible so that the underlying colour remains visible.

Mix of glazed bricks

New Build Housing

Glazed bricks also give a new facade or wall an eye-catching effect. Let your creativity run wild. Consider for example the uniform use of one colour, or of combinations in one colour with different textures, formats or shapes. On the other hand, a playful colour palette can give extra expression to a facade when required.

Special effects can also be created by using accents and areas with glazed bricks, creating contrasts in colour or texture with other materials. There are also other applications aside from facade exteriors. Glazed bricks are extremely suitable for seating elements, for example, either outside or in waiting rooms for public transport. Both for exterior and interior applications.

Wienerberger develops solutions with builders, designers and users to create maximum freedom for individual expression. The glazed bricks can be fully custom designed and manufactured. In fact, anything is possible.

Waterstruck bricks, rough elegance

The white, opal-white, grey-white and quartz-grey bricks have also been given a matt engobe. This is a layer of clay that is fired onto the brick. It accentuates the stunning colour shades of these bricks.

With Waterstruck Special your facade radiates rough elegance. Because the long, slender bricks have a rough edge. Literally.

The weathered, lightly planed look is the result of a clever mix of natural clay and water during a unique production process. The clay is pressed into a mould, rolled and then removed from the mould using the Waterstruck method.

Free reign for shades of colour

On the matt, unsanded brick, all manner of hues are given free reign. Some bricks also have an engobe: an extra layer of clay that highlights the shades in the brick even more.

Versatile application

You can process the bricks exactly as you want, in both new builds and renovation projects. Consider, for example, using thin mortar or glue with the long, slender bricks to emphasise the linear nature of the facade. In this way, the robust look and trendy appearance of Waterstruck Special also get full attention.

Cassia, unique colours for a unique brick

Changing appearance, permanent character

Cassia, unusually long for a facing brick at nearly 50 cm, has two different sides: one is planed smooth and the other is fractured or broken. This variation gives a stylish, creative effect. The fracture surface between the sides is always slightly different too. Combined with its exceptional length, this adds extra emphasis to the linear nature of the facade. The result? A facade that really says something and that people will also talk about. Cassia bricks are extremely resistant to frost and are available in three variants: Graphite Black, Red and Shadow.

Cassia gets its unique shapes from a special process. The bricks are delivered in pairs that are joined together and can very easily be broken apart at the building site. As a result, each brick has a smooth side and a broken side, which adds an extra accent to the structure of fine lines, and creates fascinating nuances of light and colour.

Cassia facing bricks can have a variety of appearances in the wall

Circular economy, also with bricks

Wienerberger completes the circle

To reduce raw material consumption, CO₂ emissions, the environmental impact and waste production, the construction sector is focusing on circular economy. Wienerberger is not lagging in this endeavour; on the contrary.

Various solutions

In addition to their broad and high-quality applicability, our clay roof tiles, clay pavers and bricks have a long service life, making them suitable for multiple use-cycles. To make future reuse of bricks easier, building professionals can resort to easily removable lime mortars. Another technically sophisticated solution is ClickBrick, a 100% reusable drystack system for extruded facing bricks. Finally, in many cases our ceramic products can be used for high-quality recycling.

ClickBrick: 100% circular

ClickBrick is a modular drystack system that connects grooved polished with small stainless steel clips. Due to its special shape, the clip clamps itself into the groove and the bricks are firmly anchored. Thanks to this mechanical connection, the contractor can easily remove the bricks afterwards and reuse them elsewhere. ClickBrick can therefore justifiably boast a silver cradle-to-cradle certification. The system creates a ventilated cavity wall, which you can complete according to your wishes in terms of degree of insulation and back wall construction. The cavity anchors are attached with stainless steel clips, just like the facing bricks.

Technically, the system functions extremely well, as various implementations have been showing for several years. The flat-cut bricks have a customised calibration with minimal tolerances, namely: < 0.1 mm in height and < 1.5 mm in length. The facade is completely drawn and detailed in advance. It goes without saying that you can rely on the expertise of our specialised staff for the preparation and start-up of the site. The required accessories have been developed to perfectly take care of all the details.

For ClickBrick, standard-sized, perforated, pressed bricks are used, which are available in various colours and structures. Of course, in addition to whole bricks, the assortment also includes half bricks, corner bricks, lintels and exposed bricks. ClickBrick can also offer aesthetically outstanding features. Jointless walls lend themselves perfectly to a monolithic design and are permanently beautiful thanks to the characteristics of the ceramic bricks. The facades are also maintenance-free, because moss and algae don't get the chance to attach and the use of mortar rules out efflorescence.

Have a look at our terracotta ventilated facade system

Argeton

Argeton was developed as a ceramic panel element for rear-ventilated curtain facades at the beginning of the 1980s. The objective was to create a timeless, modern facade with the distinctive character of clay as a natural product. Today, the name Argeton stands for quality, aesthetics and creativity. This success story is based on professional and forward-thinking product development, service-oriented sales and consistent quality assurance.

The Argeton facade crowns new, modern buildings and adds a contemporary character to restored property. In combination with steel, glass or wood, the Argeton facade impresses with its timeless perfection, elegance and naturalness. The aesthetics of the Argeton facade remain intact over many decades: a sophisticated water drainage prevents contamination.

The ceramic colours remain resistant and strong, even when exposed to the toughest weather conditions. The facade is considered to be particularly fireproof. The joint profile protects the facade from lateral movement of the tiles, the penetration of rain and the clatter of tiles in the wind.

Design Benefits of an Argeton Facade

- Variety of formats: see product matrix, custom-made shapes possible
- Diverse colours: in addition to the standard colours, practically any colour can be produced with engobes or glazes
- Different tile surfaces: nature, glazed, engobed, grooved or structured
- Perfect for combination with traditional construction materials: ideal for building renovation

Merits and Benefits of an Argeton Facade

Dimensional stability

The terracotta panels are always within tolerances.

Frost-resistant

According to DIN 52252, part 1

Non-fading / UV-resistant

Argeton facades are non-fade and UV resistant.

Fire protection

Fire protection classification A1
DIN 4102, EN 13501-1, non-flammable.

Ball impact safety

We are one of the few who have tested and certified ball impact safety according to DIN 18032-3.

Scratch hardness Mohs scale 6-7

The terracotta panels reach high scratch hardness.

Resistant to aggressive substances

Argeton facades are resistant to aggressive substances. This is tested according to the standard DIN EN 10545-13

Sound insulation

Improvement of sound insulation up to 9-dB possible.

Great variety of formats and colours

In addition to the large standard range, individual shapes and colours can always be developed.

Hidden fasteners

There are no outlet trace marks on the facade surface.

Fit for the purpose of new constructions and renovations

The Argeton panels are suited for both new constructions and renovations.

High-rises

All tile dimensions are suitable for building heights over 100m.

Long-life durability

We guarantee long-life durability for our Argeton products.

No maintenance costs

There are no maintenance costs, as the clay panels are cleaned by the natural weather.

Sustainable

Natural clay is mined from the mine right next to the factory. The terracotta product then provides a natural, comfortable living environment.

Fully recyclable

Argeton terracotta products are fully recyclable or reusable.

Danish design

At the end of 2019, the Wienerberger Group acquired established Nordic companies gaining their centuries-old expertise in brick and an inspiring product portfolio. The two brick manufacturers Vesterled and Helligsø in Denmark, and the retailer Egersund, one of the best-known names in the Danish brick business, produce a variety of high-quality products. Their portfolio ranges from bricks and moulded bricks, to beams, supports and brackets, as well as special bricks, lintels and pre-cast elements.

Clay pavers

4

Clay pavers: durability, versatility and safety

A harmonious look for public spaces

Clay pavers are extremely durable. They last for an average of 125 years, keeping their colour and needing very little maintenance.

Their durability and their special aesthetic qualities make Wienerberger clay pavers the ideal solution for paved public areas. The broad range of variants means that they can be integrated into the appearance of the street. Clay pavers create peacefulness on terraces and squares. They provide unity: contributing to the harmony of colour, style and appearance, they generate an almost natural link between aesthetics and functionality.

Extremely beautiful, for both inside and outside

Who said clay pavers are only suitable for your driveway or terrace?

Today we are seeing more and more projects that create surprising effects in interiors too. Gardens or terraces, for instance, can extend indoors, creating a single whole that exudes space. Clay pavers also offer the same advantages in the home: a long lifespan, keeping their colour and shape, low maintenance, and so forth – you name it!

Water permeable clay paver Aquata

With the water permeable clay paver Aquata, you are combining five great benefits in one hand: functionality, aesthetics, regulation, ecology and a long service life. A brief explanation.

Active paving

In the market of high-quality paving material, there was a demand for clay paver for a water permeable surface. The government is increasingly interested in the infiltration of rainwater and imposes requirements for this. To meet these needs, Wienerberger has developed the Aquata clay paver, which allows rainwater to infiltrate into the soil locally. What is different about the collection is that the Aquata is equipped with spacers, so that it is installed with 6mm joints. The rainwater can seep through undisturbed and infiltrate into the soil. The paved surface consists of about 10% joints, which meets the minimum requirement for a water-permeable surface. Combined with water-permeable grouting material and ditto construction below the clay pavers, additional measures, such as placing infiltration boxes or installing 'wadis', is therefore generally not necessary.

Because the water flows away from the clay paver faster via the wider joints, it also decreases the risk of growth of algae, moss and weeds in the joints. This is extra beneficial for the appearance and ease of maintenance of the pavement. That appearance and ease of maintenance are the other great benefits of the water permeable clay paver. With the Aquata you are competing in the market segment of high-quality paving material. The non-sanded extrusion press clay pavers look pure and authentic and boast a long service life and a high sustainability score. They are available in the colour-fast tints Black, Red, Brown and Grey, and acquire an attractive patina over the years.

Big application field

Clay pavers are comfortable in use and therefore score high among those looking for high-quality paving material. In addition, they are suitable for a wide variety of applications. These pavers are particularly suitable for installing terraces and driveways, both around a private home and at a larger scale in developments. But they are also excellent for public spaces, such as parking lots, squares and cycling paths, or on evacuation routes for the fire department. They can easily handle a load of up to 500 light vehicles a day.

The Aquata water permeable clay paver illustrates all the more Wienerberger's policy regarding continuous product development, which aims for continuously better ecological and functional performance, but always with an eye for the aesthetic aspects.

Practical info

5

Good site practice

Adhering to good site practice will ensure a smooth construction process and the best aesthetic results.

Delivery and storage

From the moment bricks are delivered on site, the way in which they are handled and stored can have an effect on the appearance of brickwork at a later point.

- Bricks should be unloaded onto hard, flat, adequately drained, level ground.
- It is recommended that brick packs should never be stored more than two packs high.
- Palletised products should be stored on-site in a single layer in order to eliminate handling damage.
- Brick packs should be stored in areas which will remain free from mud, splashing by site delivery vehicles and potential staining from other materials.
- All bricks in storage should be adequately protected against rain, snow and frost.

Protection

Protection of brickwork is important to prevent it from becoming saturated, as this can lead to staining and efflorescence (minerals emerging from the clay).

- Face brickwork should be kept clean and protected; care must be taken to avoid splashing from mortar pointing.
- Incomplete brickwork should be covered with waterproof materials during breaks in construction and overnight.

Appearance

A suitable site reference panel, representative of the consignment, should be constructed prior to commencement of brickwork in order to provide an indication of the finished wall appearance. In order to ensure a consistent appearance throughout the building, bricks should be blended from a minimum of three packs at the same time in order to avoid colour banding.

Mortar

Correct mortar specification and preparation is critical to the aesthetics, durability, rain resistance and structural performance of brickwork.

- Deliveries of mortar should be protected from the elements.
- The mortar mixing area should be kept clean to avoid contamination.
- Consideration should be given to the appropriate mortar specification for different applications.

Requesting a sample

Samples of bricks, brick slips and clay pavers can be ordered through your distributor.

This document is not contractual. The colours in this folder show the natural tints of our ceramic materials as effectively as technically possible. Wienerberger retains the right to modify its range as well as the accompanying technical details. Please always check availability. Ceramic materials produced during each production run can vary slightly in colour compared to previous production runs. Samples provided in showrooms always date from previous production runs and thus only provide an indication about the colour. They are of no contractual value.

All facing bricks from Wienerberger have the internationally recognized CE label and are manufactured in accordance with EN 771-1. In addition, all factories operate in accordance with the management system ISO 9001, ISO 14001 and ISO 50001.

The products shown in this brochure are only a selection from our range. Contact us to receive the complete catalogue.
